A;Title: Leishmania gp63 molecule implicated in cellular adhesion lacks an Arg-Gly-Asp
A;Reference number: A44951; MUID:90205976; PMID:2320059
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A.Description: catalyzes the hydrolysis of peptide bonds between two hydrophobic residu A.Note: the activated form can activate the proenzyme form
A.Note: the activated form can activate the proenzyme form
C.Superfamily: leishmanolysin of the proenzyme form
C.Keywords: blocked carboxyl end; cell adhesion; glycoprotein; hydrolase; lipoprotein;
F.1-39/Domain: signal sequence #status predicted <archive.
F.40-97/Domain: activation peptide #status predicted <ARP>
F.98-574/Product: leishmanolysin #status predicted <ARP>
F.575-599/Domain: carboxyl-terminal propeptide #status predicted <CTP>
F.48,261,265,331/Binding site: zinc, catalytic (Cys, His, His, His) (inhibited) #status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ς,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AVGVINIPAANIASRYDQLVTRVVTHEMAHALG-----FSVGFFEGARILESISNVRH 288

-!- FUNCTION: CURLIN 187 THE STRUCTURAL SUBUNIT OF THE CURLI. CURLI ARE COLLED SURPACE STRUCTURES THAT ASSEMBLE PREFERRYTALLY AT GROWTH TEMPERATURES BELOW 37 DEGREES CELSIUS. CURLI CAN BIND TO FIBRORECTIN. THE MINOR SUBUNIT IS THE NUCLEATION COMPONENT OF CURLIN MONOMERS.

-!- SIMILARITY: BELONGS TO THE CSGA/CSGB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE FROM N.A.

Mol. Biochem. Parasitol. 48:173-184(1991).

I. FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

CATALYTIC ACTIVITY: Preference for hydrophobic residues at P1 and P1' and basic residues at P2 and P3'. A model nonapeptide is cleaved at Ala-Tyre | Leu-Lys-Lys-Lys-Lys-Lope...

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBCELLULAR LOCATION: Attached to the membrane by a GP1-anchor.

SIMILARITY: Belongs to peptidase family M8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8 AFAAIVVSGSALAGVYDQLVTRVVTHEMAHASGPDSTLSIYQYGSANAALALQSDAR--- 64
"Three distinct RNAs for the surface protease gp63 are differentially expressed during development of Leishmania donovani chagasi promastigotes to an infectious form.";

" Biol. Chem. 267:1888-1895(1992).

" FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

- FUNCTION: Has an integral role during the infection of macrophages in the mammalian host.

- CATALVITC ACTIVITY: Preference for hydrophobic residues at P1 and P1 and basic residues at P2 and P3'. A model nonapeptide is cleaved at -Ala-Tyr-|-Leu-Lys-Lys-.

- CORACTOR: Binds 1 zinc ion per subunit (By similarity).

- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.

- SMILARITY: Belongs to peptidase family M8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (BY SIMILARITY).

16-OCT-2001 (Rel. 40, Last annotation update)
Outer membrane protein B precursor (168 kDa surface-layer protein)
(Surface protein antigen) (Cell surface antigen 5) (Sca5) (rOmpB)
(rOmp B) [Contains: 120 kDa surface-exposed protein (Surface protein antigen) (120 kDa outer membrane protein ompB); 32 kDa beta peptide).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- FUNCTION: THE 32 kDa BETA PEPTIDE MAY SERVE AS A MEMBRANE ANCHOR (By similarity)
-!- SUBCELLIAR LOCATION: Cell wall. This bacterium is covered by a S layer with hexagonal symmetry.
-!- SIMILARITY: BELONGS TO THE RICKETTSIAE OMPA/OMPB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Uchiyamä T.; "Sequencing of the gene encoding the protein {\tt rOmp\ B} of Rickettsia

                                                                                                                                                                                            -!- FUNCTION: Ice nucleation proteins enable bacteria to nucleate crystallization in supercooled water.
-!- SUBCELLULIAR LOCATION: Outer membrane.
-!- DOMAIN: CONTAINS 126 INFERENCY REPEATS OF A CONSENSUS OCTAPERTIDE A-G-Y-G-S-T-X-T; FURTHER ON A 16-RESIDUE AND A REGIONAL 48-RESIDUE PERIODICITY IS SUPERINFOSED.
-!- MISCELLANEOUS: A STRUCTURAL OF SYMMETRY RELATED TO THAT OF ICE NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
-!- SIMILARITY: Belongs to the bacterial ice nucleation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12 IVVSGSALAGVY-DQLVTRVVTHEMAHASGPDSTLSIYQYGSANAALALQSDARKSETTI

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antiquen. Also described are: (1) use of thin aggregative fimbriae (SEFI7/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native
                                                                                                                                                Salmonella; agfA; chromosomal gene replacement; fimbrin; epitope;
                                                                                                               AgfA::PŤ3#4 amino acid sequence SEQ ID NO:18.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Kay WW;

copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign animo acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogensicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                       ó

Also described are: (I) use of thin aggregative finbriae (SERT/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of finbriae comprising recombinant AgfA. CsgA and AgfA.homologue fimbrin subunits, respectively; (2) directing recombination of a recombination of a recombination of a recombination of back into the chromosome of the homologous species; (3) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination and (4) eliciting an immune response in an animal, comprising a separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or
                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                           SDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

  used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (I) use of thin aggregative fimbriae (SET17/TAF) nucleation depended assembly system of strains of Salmonella. Bscherichia coll and Enterobacteriacese for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful foe eliciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to $500,000 copies/Cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDYDQLVTRVVTHEMAHALO

```
directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombinant gene back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segment of foreign amino acid sequence or sequences grown on a Salmonella, B. coli or Enterobacteriaceae host cell, from the host cell and introducing the coll setul for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit for carrier fimbrial subunit for directing an immune response important for directing an immune response important for directing an immune response important for directing an immune response important for dimbriae are easy and against the inserted epitope, and hybrid fimbriae are easy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA concerning the monodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbrine (SEPI)/TAP) mucleation depended assembly system of strains of Salmonella, Escherichia coli and addances for the production of fimbriae comprising recombinant C AgfA, CsA and AgfA-homologue fimbrin submits, respectively; (2) directing recombination of a recombinant gene composition species; (3) directing recombination of a recombinant gene composition species; (3) directing recombination of a recombinant gene copy of that gene; and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, copy of that general are placement segment or segments of foreign amino acid polymer comprising separating a replacement segment or segments of foreign amino correction containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or copy acid in the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful costiciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to vaccine, the carrier fimbrial submit protein are usually strong immunogens, which may be important for directing an immune response cagainst the inserted epitope, and hybrid fimbriae are easy and given in conspensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               43 ----YDQLVTRVVTHEMAHALQSDARKSETTITQSGYGNGADVGQGADNSTIELTQNGF

directing recombination of a recombinant gene into the chromosome of the homologus species, a recombinant gene into the chromosome of the homologus species, replacing the native comprising that gene and (4) eliciting an immune response in an animal, copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an animo acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or comprising a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or coli sequence or sequences grown on a Salmonella, E. coli or coli sequence or sequence in an animal. In a fimbrial presentation system the heterologus antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens; which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and in the presentive is given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ----ALQSDARKSETTITQSGYGNGADVGQGADNSTIELTQNGFRNN 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbriae (SETI//TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDYDQLVTRVVIHEMAH---

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbried (SPEPI/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant of Enterobacteriaceae for the production of fimbriae comprising recombinant of AgrA, CGSA and AgfA-homologue fimbria subunits, respectively; (2) directing recombination of a recombination of a recombinant gene into the chromosome of the homologus species, replacing the native comprising separating an aminologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. Coli or Enterobacteriaceae host cell, from the host cell and introducing the coliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to coliciting an immune response in an animal in a fimbrial presentation system the heterologous antigens are presented in high numbers (up to conding, the carrier finbrial subunit protein are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are usually strong immunogens, the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SDARKSETTITOSGYGNGADVGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120

back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbriae (SEFI7/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CSgA and AgfA-homologue fimbrin subunits, respectively, (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant of a recombinant gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pensive to purify in large amount. The present sequence is given in exemplification of the present invention
                                                                                                                                                                                          Salmonella; agfA; chromosomal gene replacement; fimbrin; epitope;
                                                                                                                                               AgfA::PT3#2 amino acid sequence SEQ ID NO:14.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEP17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene homologous species; (3) directing recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a recombination of a replacement segment of segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for every consist of the bushing are presented in high numbers (1) the consist of the bushing are presented in high numbers (1) the consist of the bushing an election or presented in high numbers (1) the consist of the bushing an election of the presented in high numbers (1) the consist of the bushing an election of the presented of the presented on the bushing the consist of the bushing an election which is useful for a system the heterologous antigens are presented in high numbers (1) the consist of the bushing an election of the presented of the plant of the bushing and the consist of the bushing and presented of the plant of the bushing and presented of the plant of the consist of the bushing and presented of the plant of the consist of the bushing and presented of the plant of the consist of the consist of the consist of the consist o

Also described are:
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SDARKSETTITQSGYGNGADYDQLVIRVVTHEMAHAFRNNATIDQWNAKNSDITVGQYGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
cc (1) use of thin aggregative fimbriae (SEP17/TAF) nucleation depended assembly system of strains of Salmonella. Escherichia coli and Enterbacteriaceae for the production of fimbriae comprising recombinant CC AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coll or acid sequence or sequences grown on a Salmonella, E. coll or acid sequence or sequences grown on a Salmonella, E. coll or acid sequence or sequences grown on a Salmonella, E. coll or acid sequence or sequences in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response immunogens, which may be important for directing an immune response immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEPI)/TMFP) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species, a recombinant gene back into the chromosome of the homologous species, replacing the native comprising separating are annoacid polymer comprising a replacement segment or segments of foreign annino acid sequence or sequences grown on a Salmonella, B. coli or acid sequence or sequences grown on a Salmonella, B. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or dilutent. (I) is useful for the expression of recombinant AgfA protein which is useful for unexpension of recombinant protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit protein possesses both the immunogens, which may be important for directing an immune response in manimal. The present sequence is given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequent of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbries (SERT)/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant of Enterobacteriaceae for the production of fimbriae comprising recombinant of directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a recombinant gene copy of that gene; and (4) eliciting an immune response in an animal, comprising separating a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (I) is eliciting an immune response in an animal. In a fimbrial presentation system the hererologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein sare usually strong immunogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong an immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and incompanient the inserted epitope, and hybrid fimbriae are easy and incompanient in the present invention in exemple in exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                    Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

The invention relates to an isolated peptide capable of binding a mammalian plasma protein or of generating an immune response in a mammal selected from sequences shown in ABRESGE4. ABR82GE4.-9. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, salmonella or Shigalla infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                           New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MKLLKVBAIAAIVFSGSALAGVVPQYGGGGNHGGGGNNSGPNSELNIYQYGGGNSALALQ
